

Solar Film

Solar Film

Despite spending many thousands of pounds on a beautiful new conservatory, it is a sad fact that many suffer from intolerable heat and glare problems during the summer making them virtually unusable for many months. Temperatures well in excess of 100°F and excessive glare makes an everyday pleasure such as reading the newspaper impossible.

Our solar control film applied to the inside face of your conservatory roof will significantly help.

Its metallised surface gives a dramatic reduction of the incoming solar heat by continuously reflecting it away. Our Solar Film not only reduces unwanted heat and glare, but cuts out over 99% of harmful UV rays. Our Solar Film has been designed and developed especially for application internally to most conservatory roofs including polycarbonate. Once applied it requires little or no maintenance and has high solar rejection and glare reduction properties. Not only will our Solar Film significantly reduce heat and glare but it will also protect your furniture from harmful UV rays; reducing premature fading significantly.

Solar Film will significantly reduce heat and glare and protect your furniture from harmful UV rays.
